Attending the Vocational School was more than just riding a bus and leaving campus. Students at the vocational school experienced hands-on in a field which could turn out to be a career choice.

Students in grades 9-12 were eligible for vocational training. Students under-

went a vocational program that taught them how to work with tools and equipment. Programs in agriculture, marketing, business, health, industrial, and prevocational education were available.

Depending on the type of program, classes lasted either one, two, or three periods. The length of the program also determined the number of credits a student received. Students received up to three credits.

These programs have enabled some students to go right to work in the com-

Keturah Williams takes notes on how to properly transfer a patient from a wheelchair to the bed. She and other students learned such practical procedures in Health Occupations. munity after high school. Students were able to find jobs at several of the local businesses and factories.

"I have fun going to the 'Voc' because it is interesting and educational," said sophomore Tradd Frazier.

Accounting students learned to bal-

ance spreadsheets. Health students took blood pressures. Pre-vocational students learned what the vocational school had to offer. Automotive technology students repaired automotive systems.

"I think that automotive technology is an awesome program," said senior Michael Bailey.

The Vocational School proved to be an educational and beneficial experience. Learning through classwork and handson filled the class period.
